

# The roadmap to 2050 and the energy security concerns

*Dr Silvia Pariente-David*  
*Senior Advisor, Energy and Climate Change*

**7<sup>th</sup> AIEE Energy Symposium, Plenary Session # 1**  
**Rome, 15 December, 2022**

# ENERGY CRISES: EXACERBATING OR SOLVING THE ENERGY TRILEMMA?

# EU VISION FOR A CLEAN PLANET FOR ALL

## ROAD TO CLIMATE NEUTRAL ECONOMY: STRATEGIC PRIORITIES

### EMBRACING CLEAN, SAFE AND CONNECTED MOBILITY

Decarbonising the transport sector by using alternative means of transport, connected and automated driving combined with the roll-out of electric vehicles and enhanced use of alternative fuels

### PUTTING INDUSTRIAL MODERNISATION AT THE CENTRE OF A FULLY CIRCULAR ECONOMY

Reaping first mover benefits by modernising existing installations and investing in new carbon neutral and circular economy-compatible technologies and systems

### REAPING THE FULL BENEFITS OF BIO- ECONOMY AND CREATING ESSENTIAL CARBON SINKS

Creating natural sinks by developing more sustainable land-use and agriculture

### TACKLING REMAINING CO<sub>2</sub> EMISSIONS WITH CARBON CAPTURE AND STORAGE

Compensating for remaining greenhouse gas emissions in our economy and creating negative emissions

### MAXIMISING BENEFITS FROM ENERGY EFFICIENCY

Reducing energy consumption by close to half between 2005 and 2050

### DEVELOPING SMART NETWORK INFRASTRUCTURE AND INTERCONNECTIONS

A modern and smart infrastructure, ensuring optimal sector coupling and enhancing regional cooperation, is the cornerstone of the energy transmission and distribution landscape of tomorrow

### FULLY DECARBONISING EUROPE'S ENERGY SUPPLY

Large scale electrification of the energy system coupled with deployment of renewables will decarbonise our energy supply and significantly reduce our dependency on third country suppliers

# REPOWEREU: COMPLEMENTS GREEN DEAL/FIT FOR 55 IN QUEST CARBON NEUTRALITY, WHILE REDUCING DEPENDENCY ON RUSSIA

Source: European Commission

# REPowerEU: affordable, secure and sustainable energy for Europe

## Short-term measures

- Common purchases of gas, LNG and hydrogen via the EU Energy Platform for all Member States who want to participate as well as Ukraine, Moldova, Georgia and the Western Balkans
- New energy partnerships with reliable suppliers, including future cooperation on renewables and low carbon gases
- Rapid roll out of solar and wind energy projects combined with renewable hydrogen deployment to save around 50 bcm of gas imports
- Increase the production of biomethane to save 17 bcm of gas imports
- Approval of first EU-wide hydrogen projects by the summer
- An EU Save Energy Communication with recommendations for how citizens and businesses can save around 13 bcm of gas imports
- Fill gas storage to 80% of capacity by 1 November 2022
- EU-coordination demand reduction plans in case of gas supply disruption

# ANALYSES BY THE EUROPEAN CLIMATE FOUNDATION INDICATES THAT SECURING EUROPE’S ENERGY SUPPLY AND MEETING ITS CLIMATE COMMITMENTS ARE NOT INCOMPATIBLE

There are 15 structural levers across supply and demand available for the EU to reduce gas demand or shift to alternative suppliers

Impact assessed per lever - not in combination		Gas offset potential <sup>2</sup> , bcm		Climate impact <sup>1</sup> , MtCO2e	
Lever		2022	2025	2022-2030 cumulative	
1 Increase LNG imports to existing terminals		<div><div></div></div> ~57-70	<div><div></div></div> ~53-66		<div><div></div></div> ~160-200
2 Increase coal-fired power generation		<div><div></div></div> ~20-25	<div><div></div></div> ~23-33		<div><div></div></div> ~380-470
3 Increase piped gas imports		<div><div></div></div> ~5-6	<div><div></div></div> ~1-2		<div><div></div></div> ~0-1
4 Accelerate RES deployment		<div><div></div></div> ~4-5	<div><div></div></div> ~22-28	<div><div></div></div> ~ -(570-460)	
5 Increase LNG import via temporary FSRU terminals		<div><div></div></div> ~2-3	<div><div></div></div> ~26-32		<div><div></div></div> ~50-65
6 Accelerate buildings electrification & energy efficiency		<div><div></div></div> ~1-2	<div><div></div></div> ~9-12	<div><div></div></div> ~ -(290-230)	
7 Increase biomass use in power and heat generation		<div><div></div></div> ~1-2	<div><div></div></div> ~0-1	<div><div></div></div> ~-(4-3)	
8 Delay industry coal-to-gas transition		<div><div></div></div> ~1-2	<div><div></div></div> ~-(0-1)		<div><div></div></div> ~0-1
9 Accelerate industry electrification & energy efficiency		<div><div></div></div> ~0-1	<div><div></div></div> ~10-13	<div><div></div></div> ~-(75-60)	
10 Increase nuclear power generation		<div><div></div></div> ~0-1	<div><div></div></div> ~3-4	<div><div></div></div> ~-(60-50)	
11 Increase use of biogas and biomethane		<div><div></div></div> ~0-1	<div><div></div></div> ~3-4	<div><div></div></div> ~-(80-65)	
12 Reduce leakage and flaring		<div><div></div></div> ~0	<div><div></div></div> ~0-1	<div><div></div></div> ~ -(15-12)	
13 Add new onshore LNG terminals		<div><div></div></div> ~0	<div><div></div></div> ~8-10		<div><div></div></div> ~15-20
14 Expand existing onshore LNG terminals		<div><div></div></div> ~0	<div><div></div></div> ~6-8		<div><div></div></div> ~10-15
15 Increase Green hydrogen and ammonia supply <sup>3</sup>		<div><div></div></div> ~0	<div><div></div></div> ~ -(1-0)		<div><div></div></div> ~120-155
Total		<div><div></div></div> ~91-117	<div><div></div></div> ~162-211		
Russian gas supply to offset		<div><div></div></div> 153-167	<div><div></div></div> 153-167		

1. Net change in cumulative emissions 2022-2030 from maximum lever potential vs. baseline scenario, which includes successful implementation of Fit for 55 measures

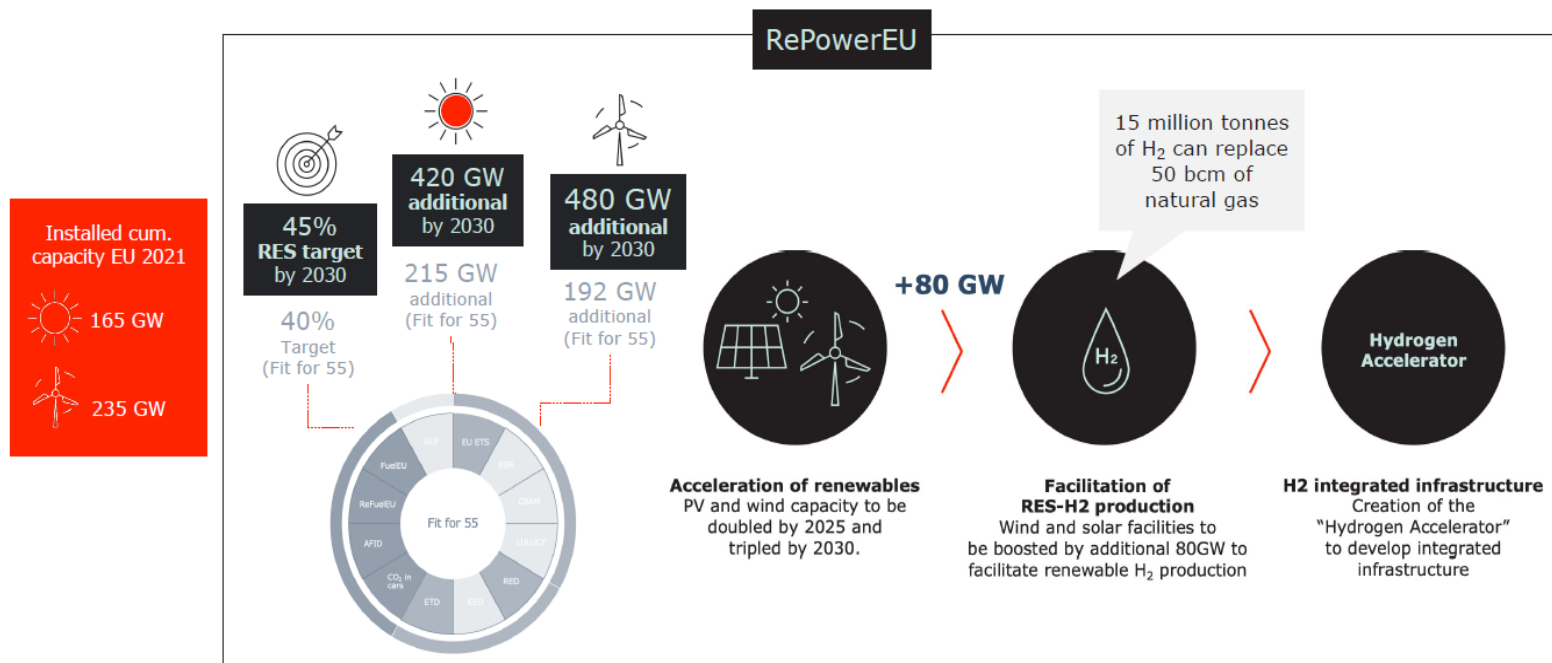

2. Theoretical potential to offset Russian gas supply (as compared to 2021 levels for levers 1,3,5,7,8,10,11,12) or reduce gas demand (as compared to 2022/25 projections for levers 2,6,9,10,13,14,15 or compared to Fit For 55 target for lever 4 (RES)); low values indicative of +/-10% uncertainty in analysis of maximum theoretical potential; actual gas offset potential realized will depend on commitment to levers as well as external factors such as global LNG price dynamics, raw material or labor availability, and more

3. REPowerEU target includes import of 10MT of green H2 by 2030, which would reduce dependence on imported gas as well as unlock further emissions; impact here reflects production which can be ramped up by 2025; because green hydrogen relies on renewables that would otherwise be used to displace gas in the power sector, the impact on gas demand is negative until ~2030, at which point the power mix is sufficiently renewable for green hydrogen to effectively displace gas

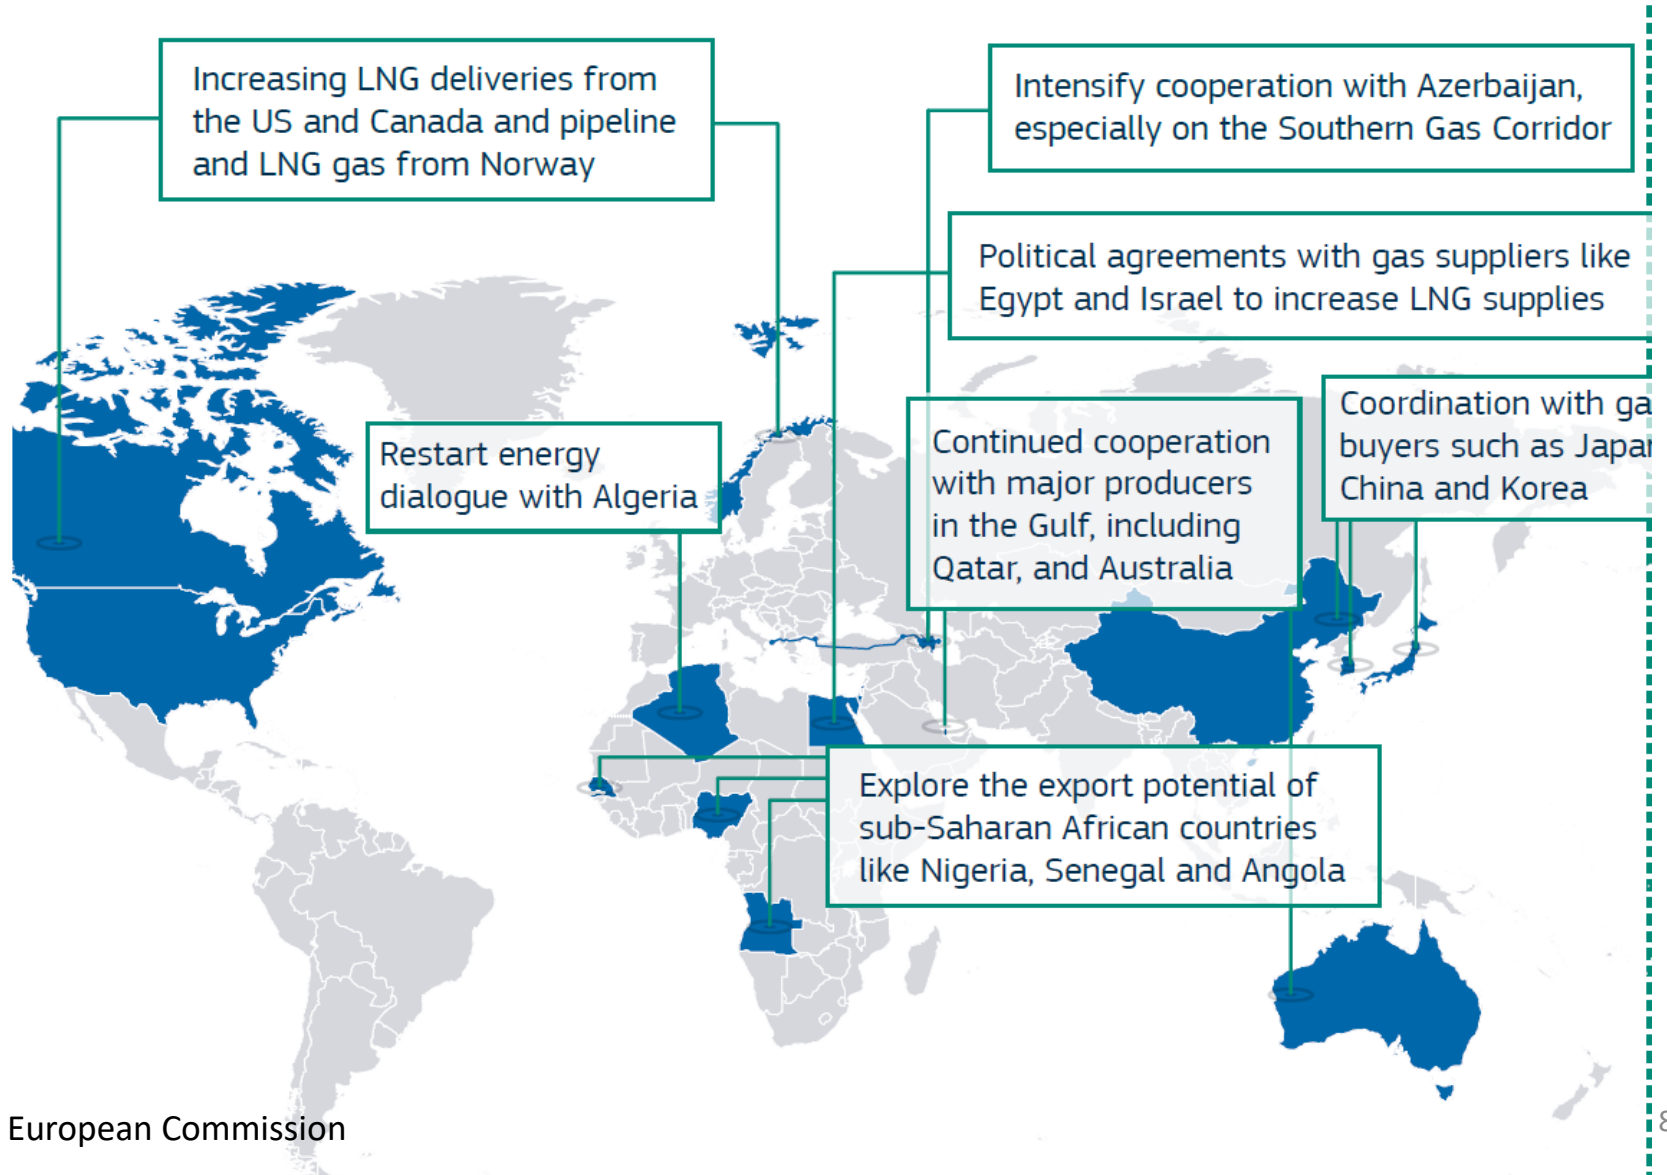

# RES and H2 targets dramatically increased with RePowerEU

The EU Strategy will diversify supply and replace natural gas with renewable gases reducing EU dependency on fossil fuels

# EU EXTERNAL STRATEGY TO ENCOURAGE PARTNERSHIPS FOR BETTER SUPPLY NEGOTIATING POWER AND SUPPORTING ENERGY TRANSITION IN NEIGHBOURHOOD

---

## A NEW PARADIGM FOR ENERGY SECURITY: FROM SELF SUFFICIENCY TO COOPERATION AND MARKET INTEGRATION

---

---

# ENERGY SECURITY AND DECARBONIZATION

## CONVERGENCE OR DIVERGENCE?

---

- Paris Agreement and other climate commitments require massive RE scale-up and increased electrification
- RE are usually national energy sources, so increasing the RE penetration results in a higher level of self-sufficiency. But is autarchy synonymous to energy security?
- Moreover, production of Variable Renewable Energy (VRE) is difficult to control, more decentralized and not always available when and where needed=> threat to power system reliability and to energy security
- To cope with a high RE penetration, power systems need flexibility, and regional electricity market integration is a good way to deliver that flexibility without hurting the other objectives of security and affordability

---

## REGIONAL ENERGY MARKET INTEGRATION BENEFITS

### INCLUDE ENHANCED ENERGY SECURITY AND RES SCALE-UP SUPPORT

---

- Enhanced energy security???? (depends on definition)
- Increased power system flexibility and reliability
- Smoothing of load duration curve
- Optimized use of infrastructure and more efficient dispatch of power plants=> lower cost of supply
- Economies-of-scale on generating plants serving multiple markets
- Reduced CO2 emissions

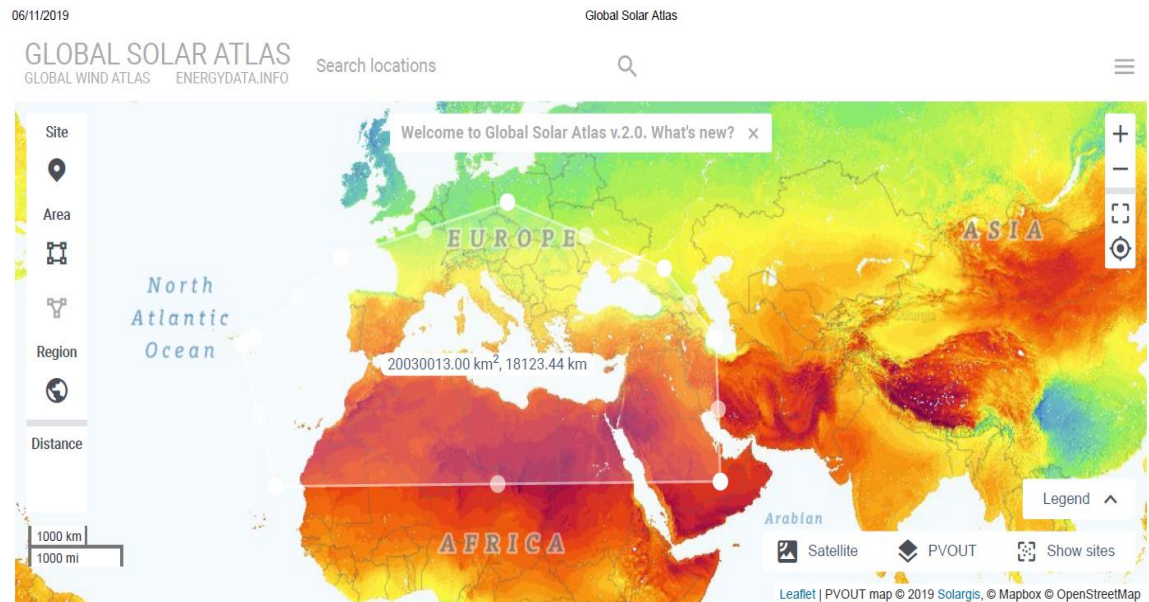

=> Increased exchanges across borders

*Might be the best solution to reconcile different objectives—for a secure low-carbon energy supply at least cost. Possible threat to energy security?*

# EURO-MEDITERRANEAN ENERGY MARKET INTEGRATION FACILITATES DECARBONIZATION...

Countries of the southern and eastern Mediterranean shores are rich in carbon-free energy resources and creating an integrated Euro-Mediterranean market would increase power system flexibility, thus supporting renewable energy scale-up

Key highlights of EU Green Deal are the need to increase cross-border trade and regional cooperation, to better share clean energy sources and to interconnect energy systems.

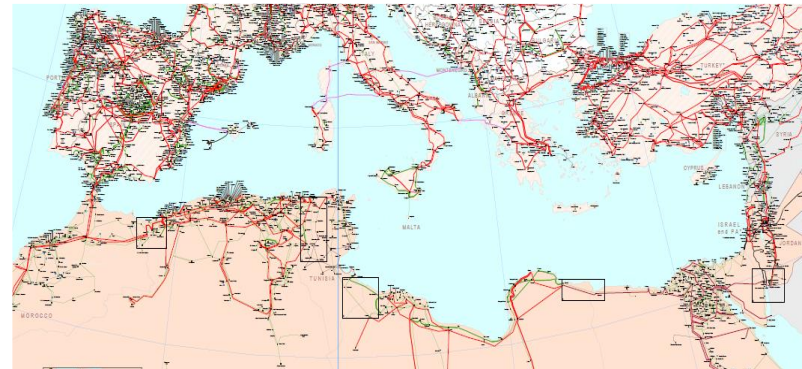

In the next software update, here the stats will be shown for the selected area

Delete and start drawing a new one

.... AND INCREASES ENERGY SECURITY BOTH FOR EUROPE AND SOUTHERN/EASTERN  
MED SHORE

# MEDITERRANEAN INTEGRATION REQUIRES INFRA (HARDWARE)... ... AND MORE (SOFTWARE)

- ❑ Hardware: interconnectors (CEF)
  - Morocco-Spain already connected
  - Turkey connected to Greece and Bulgaria
  - Several projects, but slow moving:
    - Tunisia-Italy (ELMED PCI, TuNur)
    - Algeria-Spain and Algeria-Italy
    - Israel-Cyprus-Crete (PCI)
    - Egypt-Cyprus-Crete (PCI)

- ❑ Gas transport infrastructure underutilised, could be used for hydrogen (or blend)
  - MEG no longer used to export Algerian gas (can be used for green hydrogen?)
  - Medgaz ?????
  - Trans-Med declining use trend to persist
  - Average utilisation of LNG terminals growing but not at full capacity yet

- ❑ More
  - Sector Coupling, optimize across energy forms
  - Some harmonization of market design and convergence in market operations
  - Cooperation between national TSOs (and between gas and electricity SO) and National Regulatory Authorities ... and political will to work together

**... in summary, think whole energy system and regionally/globally**

# Thank you

# Back-up Slides

# CARBON NEUTRALITY SPREADING THROUGHOUT THE WORLD

After the EU committed to achieve climate neutrality by 2050, the world's largest economies have followed suit.

- Decisions to "achieve climate neutrality by 2050" enshrined in law.
- Decisions to "achieve climate neutrality by 2050" announced.
- Decisions to "achieve climate or carbon neutrality<sup>2</sup> by 2060 at the latest" announced.

<sup>2</sup> Climate neutrality aims to reduce all greenhouse gases (GHGs), while carbon neutrality only aims to reduce carbon dioxide (CO<sub>2</sub>) emissions.

Source: Jacques Delors Institute, based on 2021 forecast data from the International Monetary Fund (IMF) and the Climate Watch Net-Zero Tracker (last accessed October 18, 2021).

Note: This graph lists the commitments of the world's 50 largest economies. More countries outside of this ranking have adopted climate neutrality goals. The list can be viewed [here](#).

All of the largest economies that aim for climate or carbon neutrality by 2050-2060 account for more than **80% of global GDP**! By delivering on their commitments together, they have what it takes to stabilise the climate.

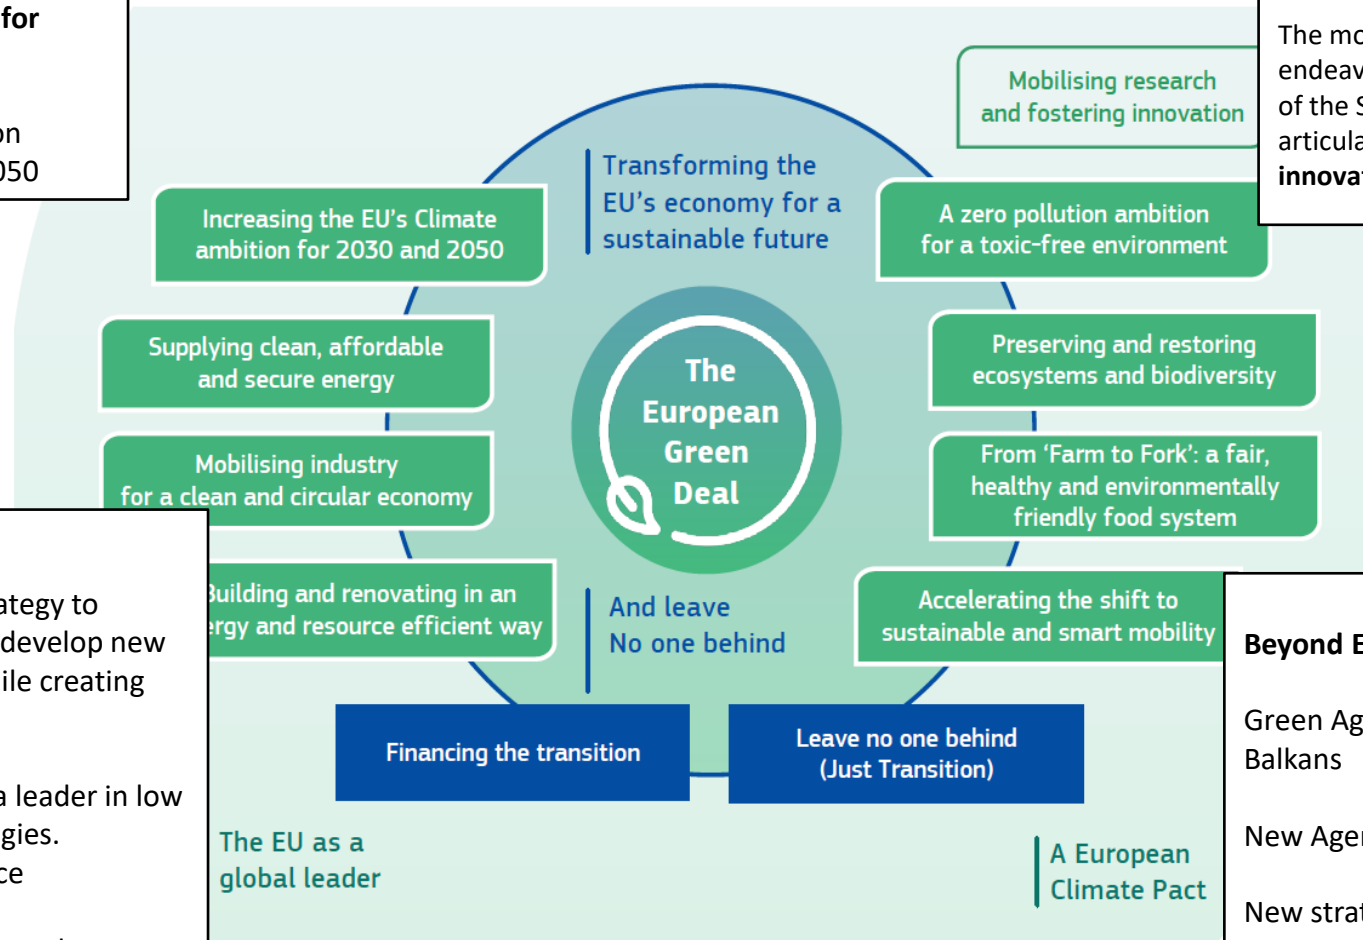

# EU GREEN DEAL DRIVES CARBON NEUTRALITY

## FIT FOR 55 PACKAGE IS THE IMPLEMENTATION INSTRUMENT

### The European Green Deal

**Interim target for 2030: -55%**  
In Climate Law  
to reach carbon  
neutrality in 2050

The most important  
endeavor since the creation  
of the Single Market:  
articulating **climate,**  
**innovation and social justice**

#### Beyond energy:

An industrial strategy to innovate and to develop new technologies while creating new markets.

Making Europe a leader in low carbon technologies.  
Hydrogen Alliance

CBAM to prevent carbon leakages

#### Beyond Europe:

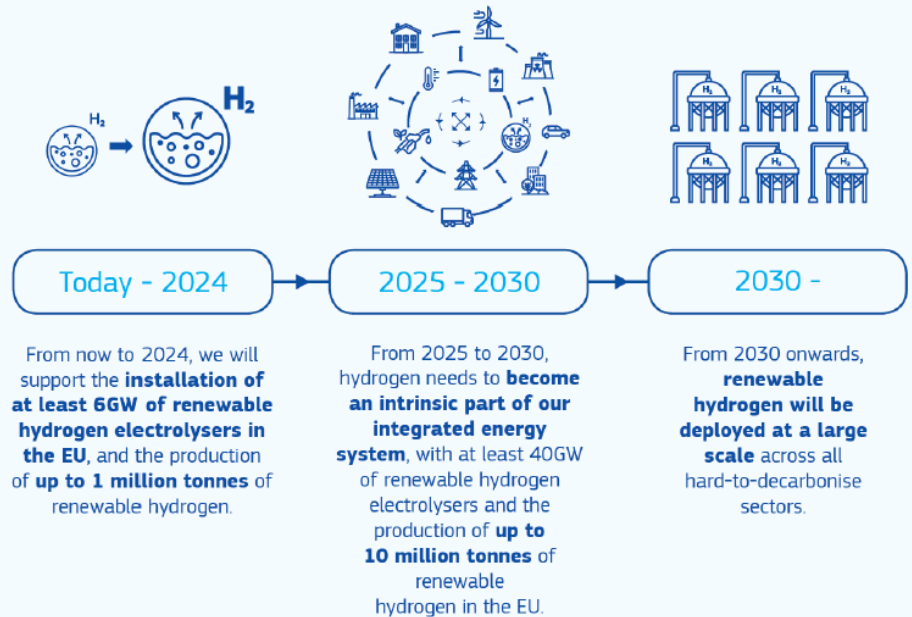

Green Agenda for Western Balkans

New Agenda for Mediterranean

New strategy on international energy engagement being prepared by EC

## EU Hydrogen strategy for a climate-neutral Europe (8 July 2020)

The path towards a European hydrogen eco-system step by step :

TU Delft

# Gas Infrastructure in Europe can be reused for hydrogen

Gas Pipeline Capacity 5-20 GW, Electricity cable capacity 0.5-2 GW

Gas transport cost roughly a factor 10 cheaper than electricity transport

## Gas Pipelines Europe

Transporting gas from gas fields at North Sea, Norway, Russia, Algeria, Libya to Europe

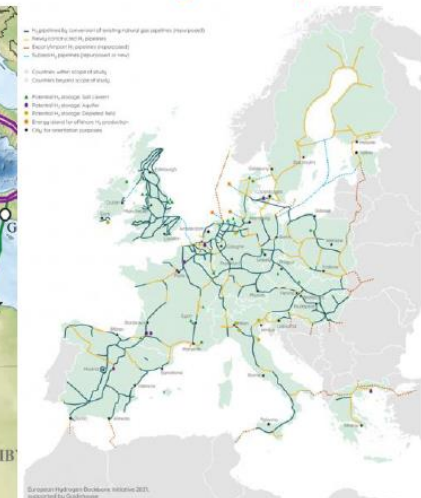

## Gas from North-Sea

2017 production  
190 bcm = 1.900 TWh

## Gas from North-Africa

60 GW Natural Gas Pipeline  
2x0.7 GW Electricity Cable

## European Hydrogen Backbone

75% re-used gas pipelines  
25% new hydrogen pipelines  
40.000 km pipelines

**Exhibit 1: Global fossil fuel demand (EJ/y) under different scenarios**

---

# WHAT IS ENERGY SECURITY?

---

- A polyseme (a concept widely used, but no consensus on its meaning or precise definition)
- According to the IEA (which was created in 1974 to address the first serious security concerns following the first Arab oil embargo): the uninterrupted availability of energy sources at an affordable price, irrespective of economic or political instability
- This definition of long-term security of energy supply has increasingly been complemented recently, due to the rapidly increasing RE penetration, with concepts specific to the electricity system: power system reliability and grid stability
- Typical energy security indicators include:
  - ❖ Self sufficiency (or the opposite, degree of import dependency)-- overall and by fuel
  - ❖ Number of external suppliers, and market share of dominant supplier
  - ❖ Primary energy mix
  - ❖ Etc.....

# POWER SYSTEM FLEXIBILITY

## THE PROBLEM AND THE SOLUTIONS

Dispatchable  
power plants

Demand side  
Response

Energy storage  
facilities

Interconnection  
with adjacent  
markets

Gas-fired  
power plant

Industrial

residential

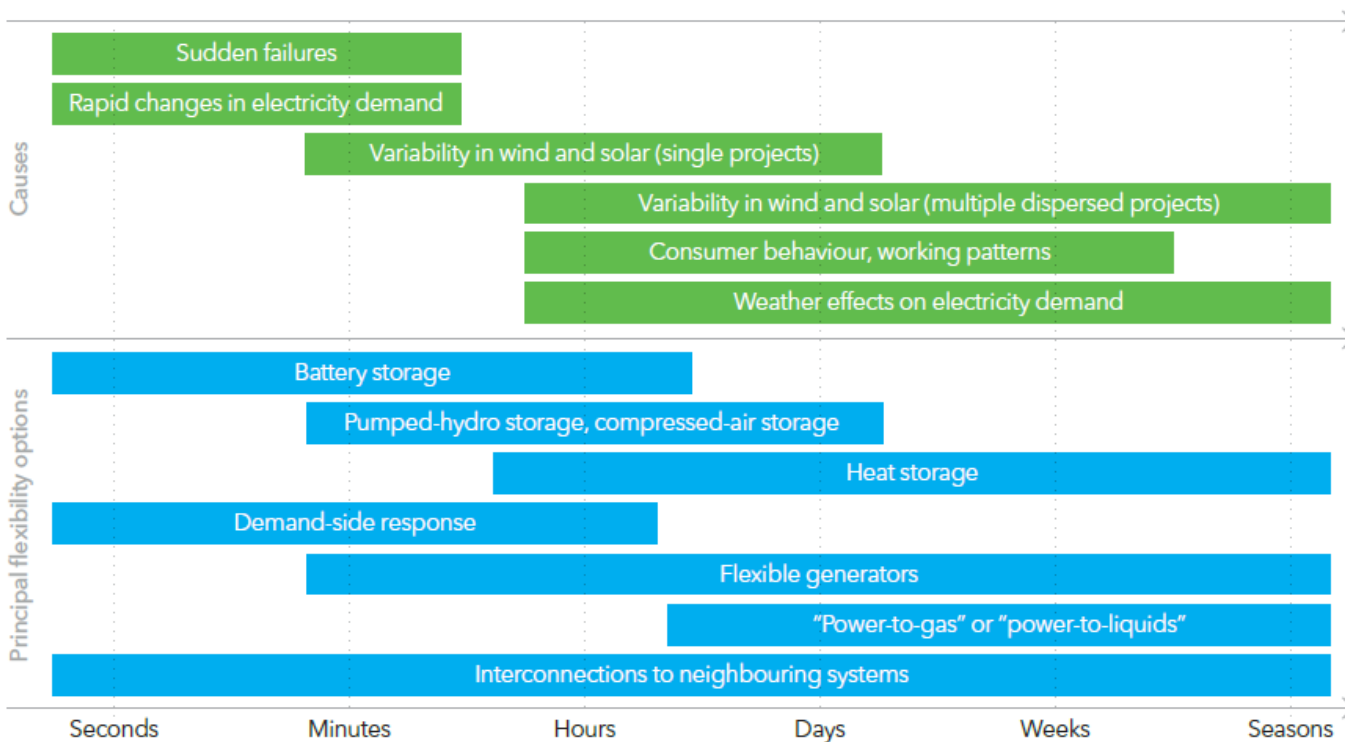

Pumped hydro  
facility

Scandinavian  
interconnections

Numerous definitions but flexibility can generally be defined as the ability of the power system to cope with sudden and unexpected changes in demand/supply

## Flexibility issues by timescale

# Sector coupling, also a source of flexibility (DSR, storage)

- Concept initiated with the coupling of the transport sector with the power sector: use electric vehicles (EV) as batteries and let power flow from EV to the grid (V2G)– since cars are parked 95% of the time
- Massive electrification of end-use sectors create new loads high in capacity but low in energy, if not properly managed. But if end-use sectors are coupled with each other and with power sector, DSR potential and storage solutions are increased
- Coupling electricity and gas (incl green gas and hydrogen) sectors is also a source of flexibility
