

# Highly-Efficient Reasoning via Trigger Graphs

Efi Tsamoura

SAIC-Cambridge

| Dec 6, 2022

| SAIC-Cambridge

SAMSUNG SEOUL R&D CAMPUS

This talk is **not** about stream reasoning...

...however, it presents a reasoning technique that can be naturally extended to reasoning in an incremental fashion.

The reasoning technique is based on a notion called **Trigger Graphs (TGs)**.

$$p(X,Y) \leftarrow e(X,Y) \quad (r_1)$$

$$p(X,Y) \leftarrow p(X,Z) \wedge p(Z,Y) \quad (r_2)$$

“Materializing Knowledge Bases via Trigger Graphs”,

**Table. Results over the VQAR benchmark (NeurIPS 2021).**

- TGs: non-probabilistic case
- TGs: probabilistic case

Standard bottom-up  
seminaive evaluation

❑ **cannot** prevent the  
derivation of logically  
redundant facts

❑ **cannot** prevent redundant  
homomorphism checks

$$r(X, Y) \rightarrow R(X, Y) \quad (r_1)$$

$$R(X, Y) \rightarrow T(Y, X, Y) \quad (r_2)$$

$$T(Y, X, Y) \rightarrow R(X, Y) \quad (r_3)$$

$$r(X, Y) \rightarrow \exists Z. T(Y, X, Z) \quad (r_4)$$

$$B = \{r(c_1, c_2)\}$$

- Reason over an instance  $\mathbf{B}^*$  that captures *\*all\** possible rule execution patterns.
- Build a TG that captures the derivations over  $\mathbf{B}^*$ .
- Eliminate nodes producing logically redundant facts:
  - preserving homomorphisms

$$r(X,Y) \rightarrow R(X,Y) \quad (r_1)$$

$$R(X,Y) \rightarrow T(Y,X,Y) \quad (r_2)$$

$$T(Y,X,Y) \rightarrow R(X,Y) \quad (r_3)$$

$$r(X,Y) \rightarrow \exists Z. T(Y,X, Z) \quad (r_4)$$

- No time to cover. Read our VLDB 2021 paper!

## TG minimization

- Computing rewritings over the TG.
- Reduce to query containment (decidable as the check does not consider the rules).

Theoretical results:

- Produce a minimal (all instance guarantees) TG.
- Decision problem is co-NP-complete.

## TG-based rule execution strategy

- TGs: non-probabilistic case
- TGs: probabilistic case (actually Datalog reasoning over tuple-independent PDBs)

- Auto-mined KGs
  - Google's Knowledge Vault
  - Microsoft's Concept Graph
- Visual Question Answering

- Why TGs should be extended?
  - We need to account for **all** possible non-redundant ways to derive each fact
  - Then, the derivations are compiled in a formula to compute the probability a derived fact is true.

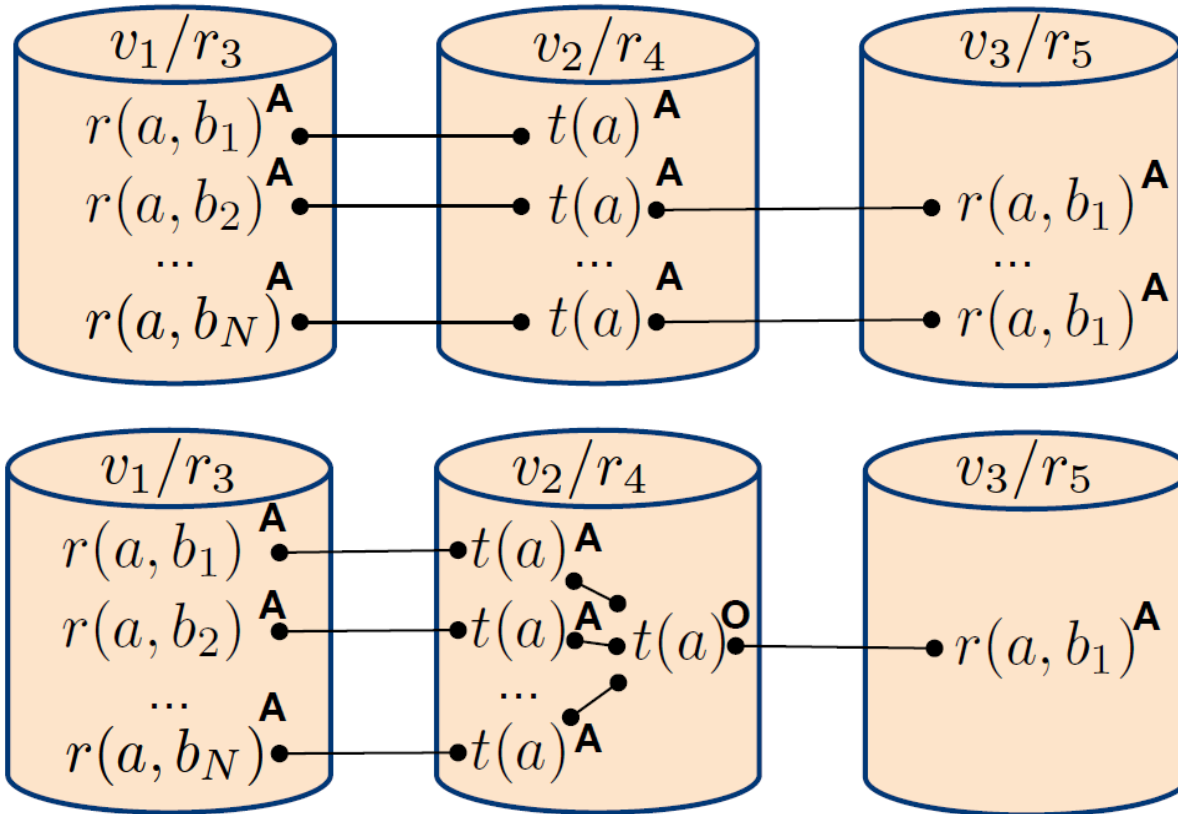

# TG-Based Probabilistic Reasoning: Intuition

- Keep the provenance at reasoning-time within the nodes of the TG (**this can be done efficiently**).
- Stop when the derivation of a fact depends on itself.

$$\begin{aligned}
 p(X,Y) &\leftarrow e(X,Y) & (r_1) \\
 p(X,Y) &\leftarrow p(X,Z) \wedge p(Z,Y) & (r_2) \\
 e(a,b), e(b,c), e(a,c), e(c,b)
 \end{aligned}$$

# TG-Based Probabilistic Reasoning: Collapsing

- The previous technique is sound... however, it can explode space-wise.
- Keep only one derivation per fact within each node.
- Extends the notion of absorptive provenance circuits [D. Deutch, ICDT 2014], but we decide when to collapse or not.

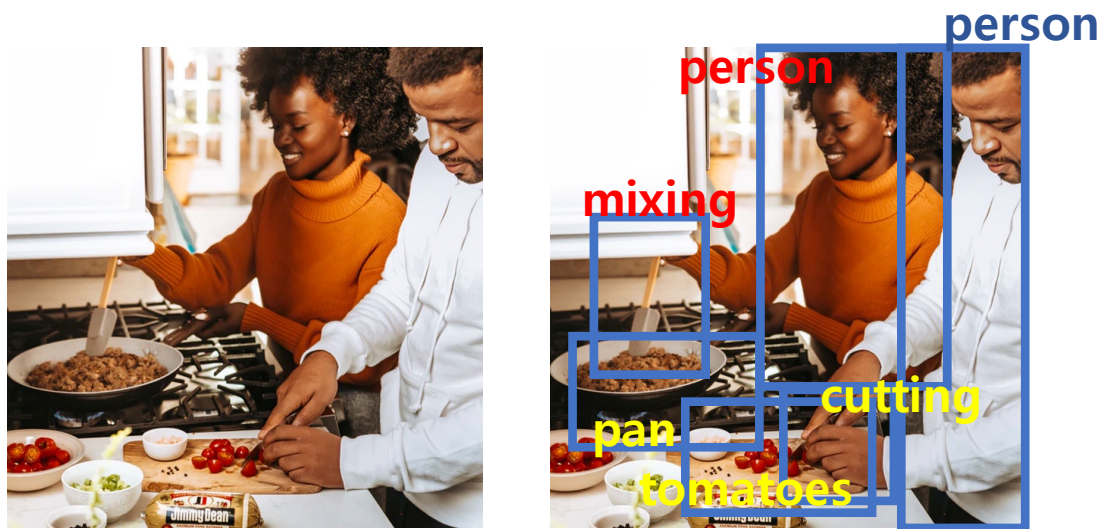

$$\begin{aligned}
 r(X, Y) &\leftarrow q(X, Y) && (r_3) \\
 t(X) &\leftarrow r(X, Y) && (r_4) \\
 r(X, Y) &\leftarrow t(X) \wedge s(X, Y) && (r_5) \\
 q(a, b_i), &\text{ for } 1 \leq i \leq N, \text{ and } s(a, b_1)
 \end{aligned}$$

- How prior art [Tsamoura et al., AAAI 2020] works? Read our SIGMOD 2023 where we explain via an example!
  - They are based on **provenance semirings** [T.J. Green, PODS 2007] and have **exponential space complexity** [D. Deutch, IC DT 2014].

Scalable Theory-Driven Regularization of Scene Graph Generation Models

Devika Buffelli<sup>1</sup>, Eshvyn Tsumura<sup>2</sup>

<sup>1</sup>University of Twente, Enschede, 7521 NB, The Netherlands, devika.buffelli@utwente.nl

Several techniques have recently aimed to improve the performance of deep learning models for Scene Graph Generation (SGG). By incorporating background knowledge, the models are able to capture the underlying structure of the scene graph, which is often missing in the data. However, this knowledge is often noisy and incomplete, which can lead to overfitting and poor generalization. In this paper, we propose a scalable theory-driven regularization framework for SGG. Our framework is based on the idea of using background knowledge to regularize the model, while also ensuring that the model is able to learn from the data. We show that our framework is able to improve the performance of SGG models on a variety of datasets.

**Introduction**  
A scene graph is a set of descriptions of the objects occurring in an image and their interrelationships. Scene Graph Generation (SGG) aims to identify all the facts that lead to an image. Using prior knowledge, the model can capture the underlying structure of the scene graph, which is often missing in the data. However, this knowledge is often noisy and incomplete, which can lead to overfitting and poor generalization. In this paper, we propose a scalable theory-driven regularization framework for SGG. Our framework is based on the idea of using background knowledge to regularize the model, while also ensuring that the model is able to learn from the data. We show that our framework is able to improve the performance of SGG models on a variety of datasets.

**Abstract**  
Structure learning is a core problem in AI, and it is often the task of finding the underlying structure of a dataset. This is often done by finding the underlying structure of a dataset, which is often done by finding the underlying structure of a dataset. In this paper, we propose a principled and efficient motif finding framework for structure learning in labeled graphical models. Our framework is based on the idea of using background knowledge to regularize the model, while also ensuring that the model is able to learn from the data. We show that our framework is able to improve the performance of structure learning models on a variety of datasets.

**1 Introduction**  
Motivation is a key concept in AI, and it is often the task of finding the underlying structure of a dataset. This is often done by finding the underlying structure of a dataset, which is often done by finding the underlying structure of a dataset. In this paper, we propose a principled and efficient motif finding framework for structure learning in labeled graphical models. Our framework is based on the idea of using background knowledge to regularize the model, while also ensuring that the model is able to learn from the data. We show that our framework is able to improve the performance of structure learning models on a variety of datasets.

Our work focuses on a principled and efficient motif finding framework for structure learning in labeled graphical models. This is often done by finding the underlying structure of a dataset, which is often done by finding the underlying structure of a dataset. In this paper, we propose a principled and efficient motif finding framework for structure learning in labeled graphical models. Our framework is based on the idea of using background knowledge to regularize the model, while also ensuring that the model is able to learn from the data. We show that our framework is able to improve the performance of structure learning models on a variety of datasets.

## Structural motifs mining for lifted graphical models under $(\epsilon, \alpha)$ -guarantees ...and some nice complexity results.
