Heat Consumption Analysis on a City Scale

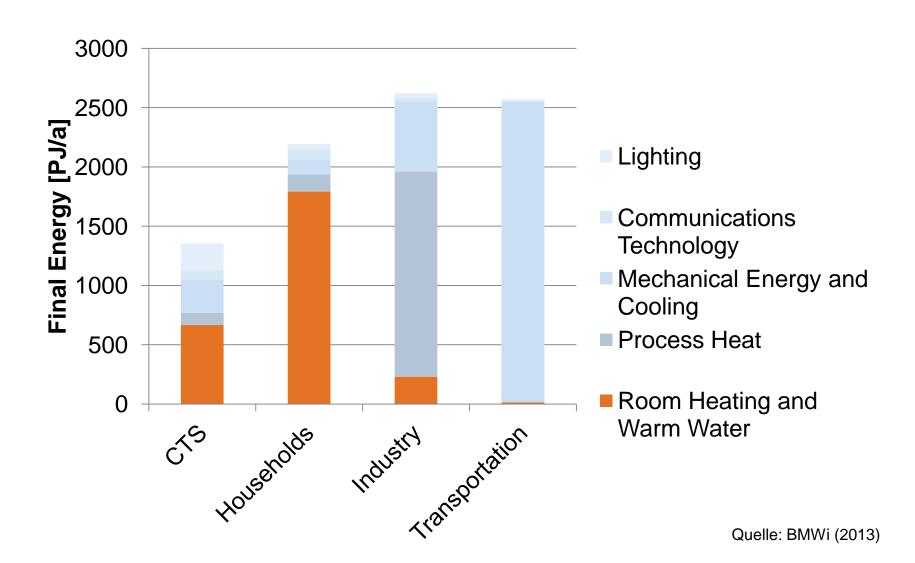

Peter Böhme¹, Thomas Hamacher¹

3rd MSE Colloquium 2013 04.07.2013

¹ Lehrstuhl für Energiewirtschaft und Anwendungstechnik, TU München

Strategies for the Energiewende in Sector Heating

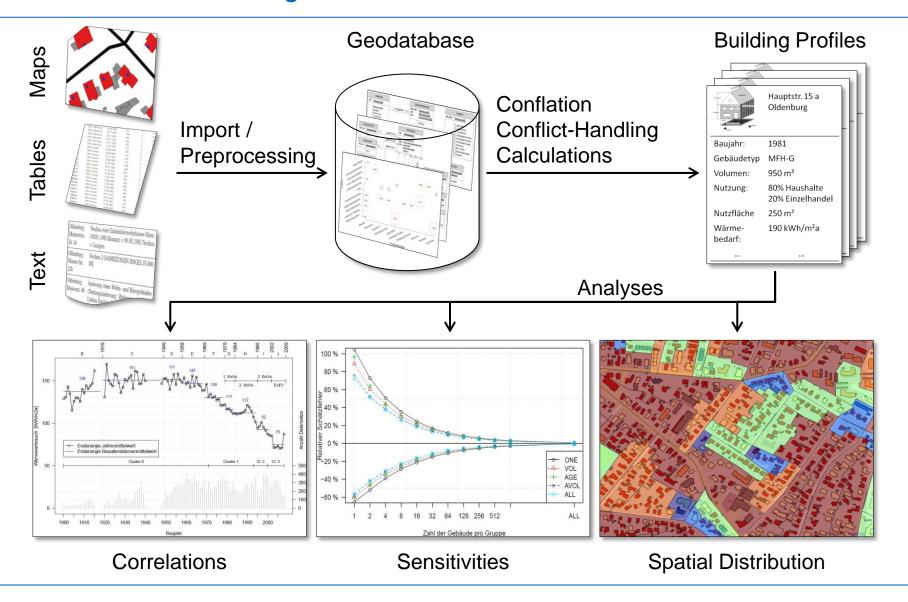

- Increase of Energy Efficiency
- Use of Waste Heat from Power Generation (CHP)
- Use of Renewable Energies

Heat System Analyses for Optimizing centralized and decentralized Heat Supply:

- 1. Drivers of Heat Consumption
- 2. Spatial Distribution of Heat Consumption

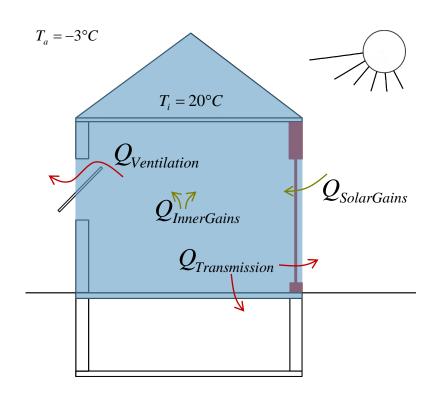

Heat Consumption Analysis based on Spatially Referenced Conflation of Building Data

Own visualisation similar to Blesl (2001)

Heat Demand: Energy Performance Rating

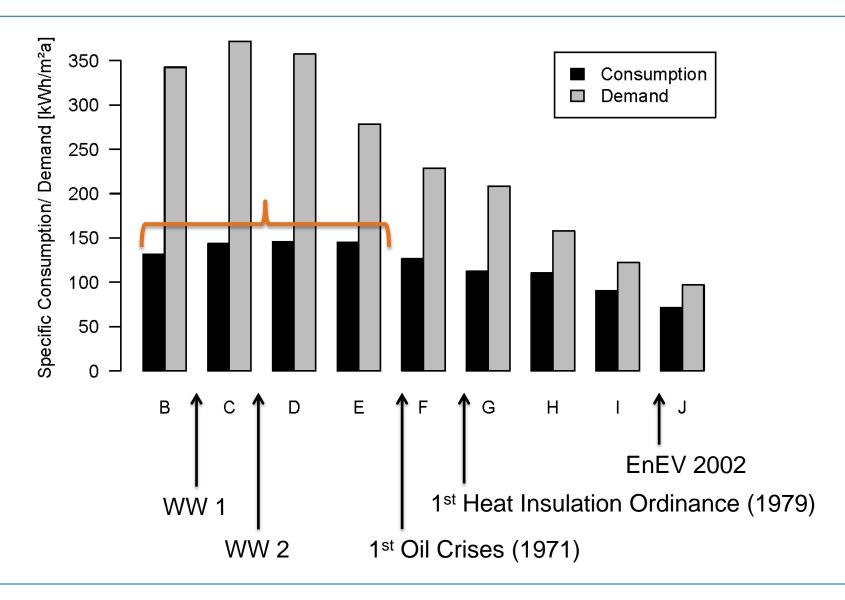

$$Q_H = Q_{Transmission} + Q_{Ventilation}$$
 $-Q_{InnnerGains} - Q_{SolarGains}$

Heat Consumption: Reality

- Historic period of construction
- Volume of heated area

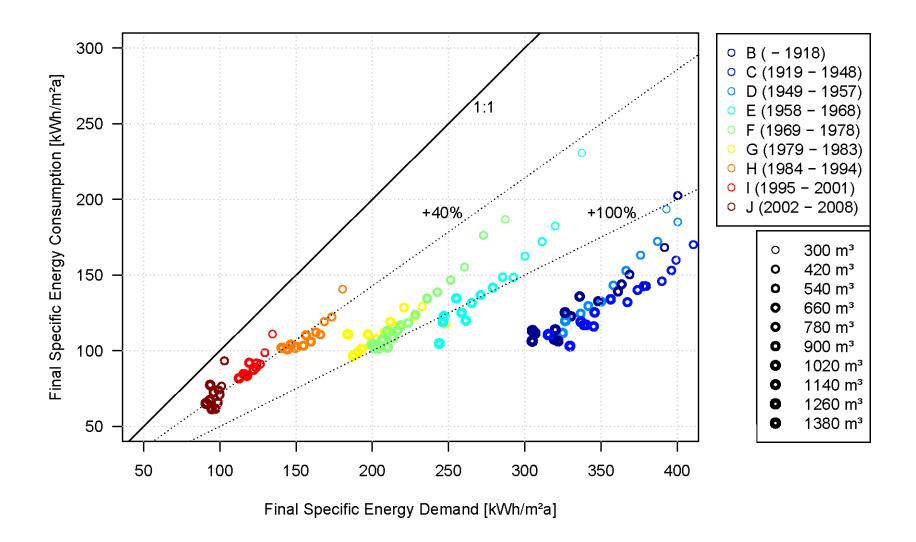

Specific Final Energy Consumption / Demand by Historic Construction Period

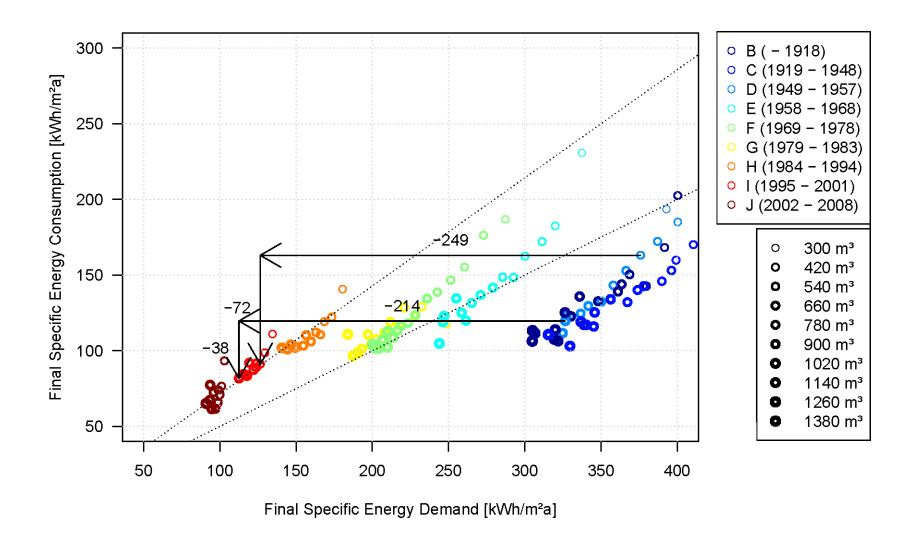

Specific Final Energy Consumption / Demand per Construction Period and Volume Class

Specific Final Energy Consumption / Demand per Construction Period and Volume Class

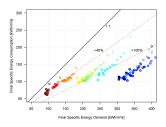

Conclusion & Discussion

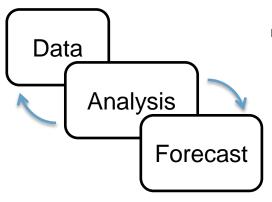

Information about the building stock

 Correlation between building parameters and heat consumption

Results:

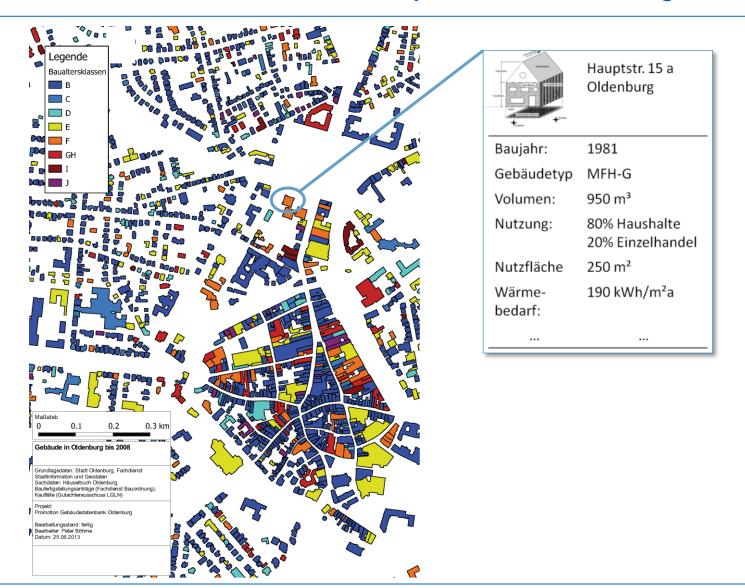

- More realistic and precise heat consumption predictions
- Better understanding of the correlation between building parameters and consumption

BACKUP

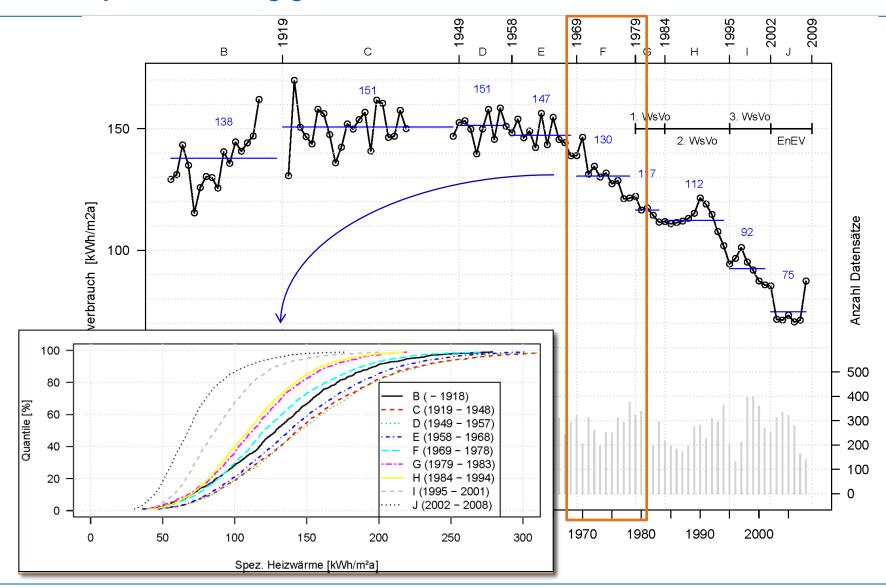

Historic Construction Periods by Color and Building Profile

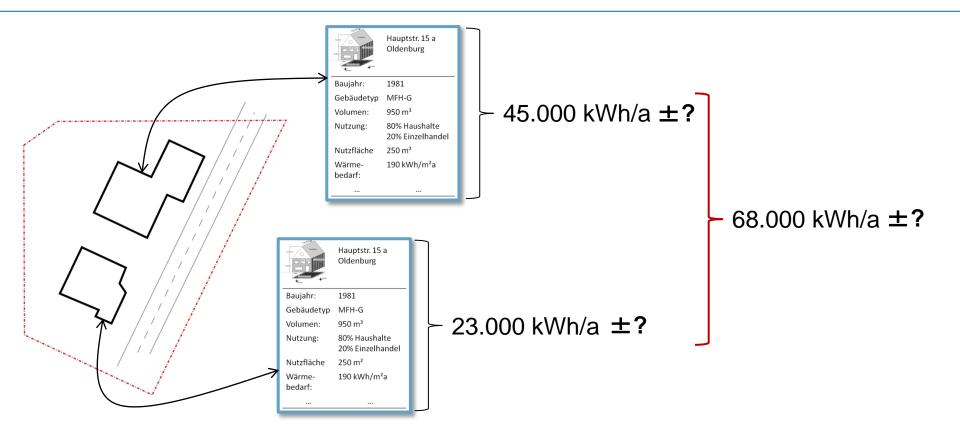

Baujahresabhängiger Wärmeverbrauch
